Vision. Value. You.

Systems Investigation and Analysis

Chapter 12

Logo of the Faculty of Engineering and Technology (fgt) of the University of Duisburg-Essen (uni-due) is displayed in the top right corner, featuring a stylized orange and yellow 'fgt' logo with the text 'uni-due' and 'Vision. Value. You.' below it.

An Overview of Systems Development

A cartoon illustration of two people wearing yellow hard hats and blue shirts, looking at a large white document or blueprint. They are standing in front of a building with a clock tower. The illustration is framed by a decorative border.

Dr. Martin Hepp

Participants in Systems Development

The diagram illustrates the central role of the systems analyst in systems development. At the center is a circle containing an icon of a person at a computer, labeled "Systems analyst". This central node is connected by one-way arrows to six surrounding roles: "Managers" (top), "Software programmers" (top right), "Technical specialists" (bottom right), "Vendors and suppliers" (bottom), "Users" (bottom left), and "System stakeholders" (top left). The "System stakeholders" role is further connected to "External companies" (top left). The entire diagram is set against a background of a city skyline. A red circle highlights the central "Systems analyst" role and its connections.

FIGURE 12-1

The systems analyst plays an important role in the development team and is often the only person who sees the system in its totality. The one-way arrows in this figure do not mean that there is no direct communication between other team members. Instead, these arrows just indicate the pivotal role of the systems analyst—an individual who is often called on to be a facilitator, moderator, negotiator, and interpreter for development activities.

Problems with existing system

Desire to exploit new opportunities, such as a new e-commerce initiative

Increasing competition

Desire to make more effective use of information

Organizational growth

Merger or acquisition

Change in market or external environment

New laws or regulations

Perception of a problem or potential benefits by individual capable of initiating change

Systems development process initiated

FIGURE 12-2

Typical Reasons to Initiate a Systems Development Project

Systems Development Life Cycle (SDLC)

Dr. Martin Hepp 8

Vision Value You

The Traditional Systems Development Life Cycle

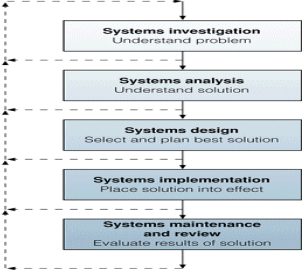

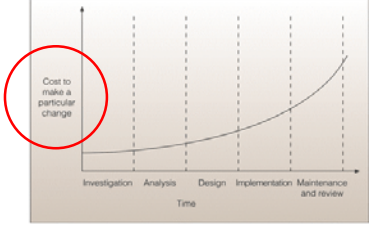

FIGURE 12.6
The Traditional Systems Development Life Cycle
Sometimes, information learned in a particular phase requires cycling back to a previous phase.

Dr. Martin Hepp 9

Vision Value You

Systems Development Life Cycle - Problems

FIGURE 12.5
The later that system changes are made in the SDLC, the more expensive these changes become.

Dr. Martin Hepp 10

Vision Value You

Advantages and Disadvantages of Traditional SDLC

TABLE 12.1
Advantages and Disadvantages of Traditional SDLC

Advantages	Disadvantages
Formal review at the end of each phase allows maximum management control.	Users get a system that meets the needs as understood by the developers; this may not be what was really needed.
This approach creates considerable system documentation.	Documentation is expensive and time-consuming to create. It is also difficult to keep current.
Formal documentation ensures that system requirements can be traced back to stated business needs.	Often, user needs go unstated or are misunderstood.
It produces many intermediate products that can be reviewed to see whether they meet the users' needs and conform to standards.	Users cannot easily review intermediate products and evaluate whether a particular product (e.g., data flow diagram) meets their business requirements.

Prototyping

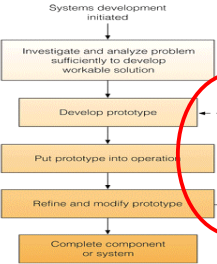

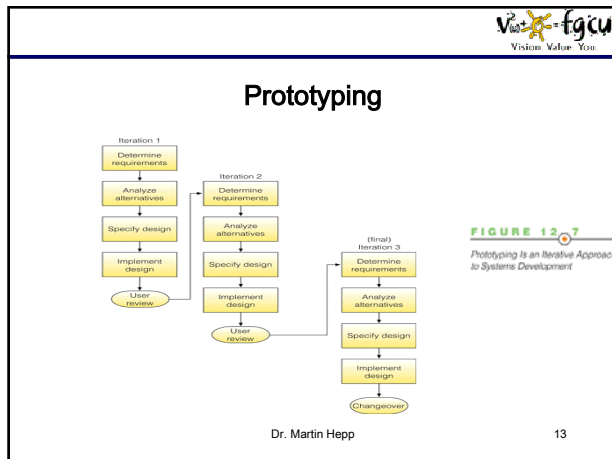

FIGURE 12.8
Prototyping is a popular technique in systems development. Each generation of prototype is a refinement of the previous generation based on user feedback.

Dr. Martin Hepp 12

Vision Value You
fgcu

Advantages and Disadvantages of Prototyping

TABLE 12-2
Advantages and Disadvantages of Prototyping

Advantages	Disadvantages
Users can try the system and provide constructive feedback during development.	Each iteration builds on the previous one. The final solution may be only incrementally better than the initial solution.
An operational prototype can be produced in weeks.	Formal end-of-phase reviews may not occur. Thus, it is very difficult to contain the scope of the prototype, and the project never seems to end.
As solutions emerge, users become more positive about the process and the results.	System documentation is often absent or incomplete, since the primary focus is on development of the prototype.
Prototyping enables early detection of errors and omissions.	System backup and recovery, performance, and security issues can be overlooked in the haste to develop a prototype.

Rapid Application Development (RAD)

TABLE 12-3
Advantages and Disadvantages of RAD

Advantages	Disadvantages
For appropriate projects, this approach puts an application into production sooner than any other approach.	This intense SCLC can burn out systems developers and other project participants.
Documentation is produced as a by-product of completing project tasks.	This approach requires systems analysts and users to be skilled in RAD system development tools and RAD techniques.
RAD forces teamwork and lots of interaction between users and stakeholders.	RAD requires a larger percentage of stakeholders' and users' time than other approaches.
